

Agentic AI Assessment: Accounts Payable Assistant

Assessment Duration: 36 Hours

Business Problem

Accounts Payable (AP) teams spend significant time manually validating invoices, matching them against Purchase Orders (POs), identifying discrepancies, raising exceptions, and coordinating with stakeholders for resolution. These repetitive activities slow down invoice processing, increase operational costs, and create bottlenecks in financial workflows.

Goal

Design and build an Agentic AI-powered Accounts Payable Assistant that receives an invoice and autonomously performs AP validation checks, matches invoice data with Purchase Orders, identifies exceptions, and recommends next-best actions to AP teams.

Solution Requirements

The proposed solution should demonstrate an autonomous AI agent workflow capable of:

- Receiving and processing invoice documents (PDF, image, or structured format).
- Extracting relevant invoice information using AI/OCR techniques.
- Validating extracted information against provided Purchase Order data.
- Performing business-rule checks (amount mismatch, quantity mismatch, missing PO, duplicate invoice detection, etc.).
- Identifying exceptions and categorizing them by severity and type.
- Generating actionable recommendations for AP teams.
- Providing reasoning and auditability for decisions made by the agent.
- Maintaining a clear workflow demonstrating agent autonomy and decision-making.

Expected Deliverables

- **Source Code** – Complete implementation with setup instructions.
- **Working Demonstration Video** – End-to-end walkthrough of the solution and agent workflow.
- **Deployed Application Link** – Accessible hosted deployment for evaluation.
- **Documentation** – Detailed project documentation covering architecture, assumptions, setup steps, and usage instructions.
- **Flow Diagram** – High-level workflow diagram illustrating the AP agent process.
- **Sequence Diagram** – Detailed interaction flow between user, AI agent, tools, systems, and stakeholders.
- **Sample Test Cases** – Example invoices and validation scenarios.
- **README** – Instructions for local execution and deployment.

Evaluation Criteria

- Agent autonomy and decision-making capability
- Accuracy of invoice extraction and validation
- Exception detection quality
- Reasoning and explainability
- Architecture and scalability
- Code quality and maintainability
- User experience and presentation
- Documentation quality

Submission

Submit all deliverables within 36 hours. The final submission should contain source code, documentation, deployment link, demonstration video, and all supporting diagrams.
